Scanning Probe Microscope

SPM-9700HT

Scanning Probe Microscope

SPM-9700HT™

Making the Unknown Visible

Scanning probe microscope (SPM) is a generic term for microscopes that scan sample surfaces with an extremely sharp probe to observe their three-dimensional image or local properties at high magnifications.
The SPM-9700HT takes high-throughput observations to the next level.

Functionality and Expandability to Meet a Wide Variety of Requirements

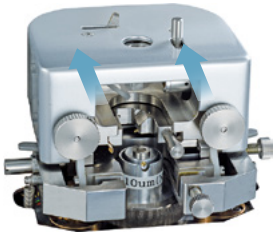
HT

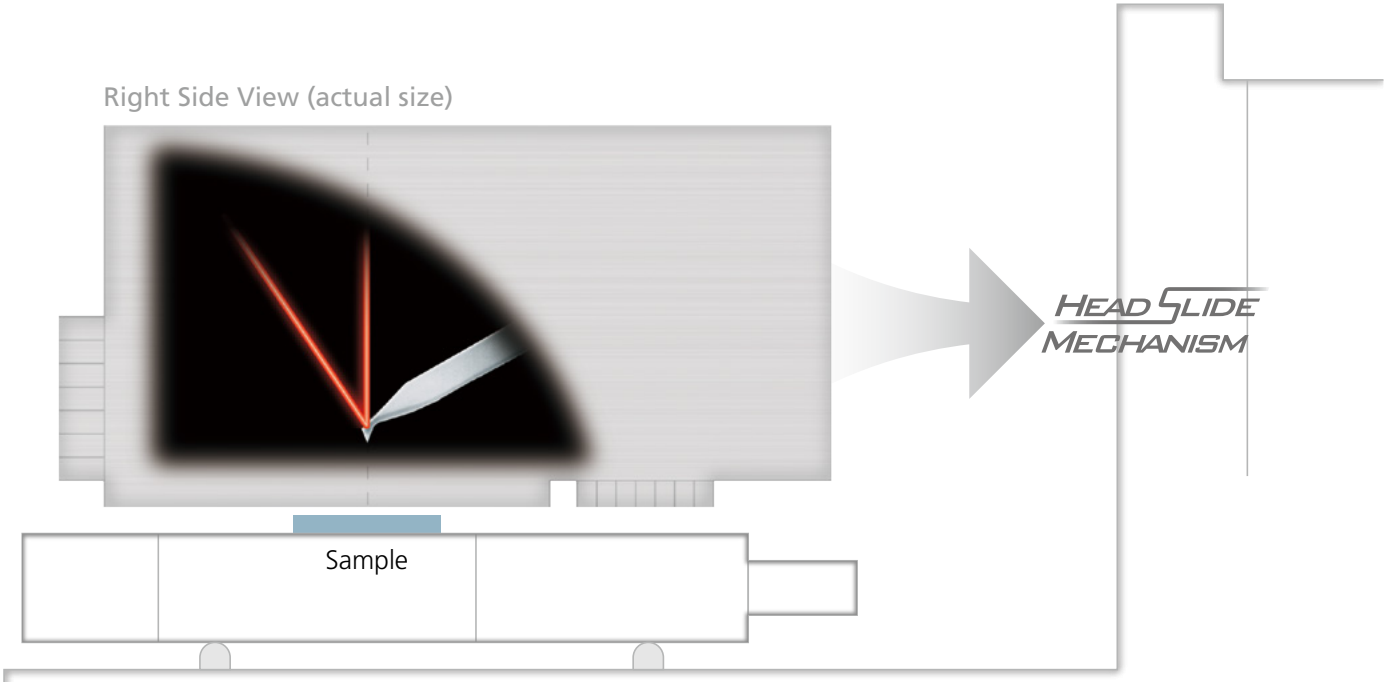
Head-Slide Mechanism — High Stability



Allows Sliding the Entire Optical Lever System as a Single Unit, While Maintaining High Rigidity.

- The laser remains stable and irradiates the cantilever even while replacing samples.
- Design is resistant to vibration, noise, wind, and other external disturbances, so a specialized enclosure is not necessary.
- The main unit includes a built-in vibration isolator.

Right Side View (actual size)

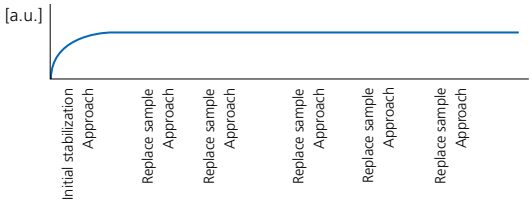


Secret to the High Stability of the SPM-9700HT

Remarkable Mechanism Maintains High Performance
—Comparison of Stability for Different Laser Irradiation—

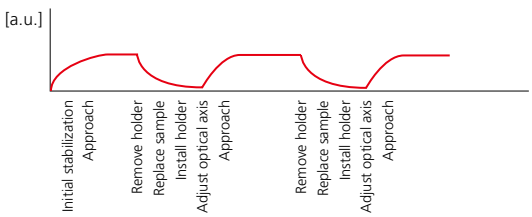
SPM-9700HT

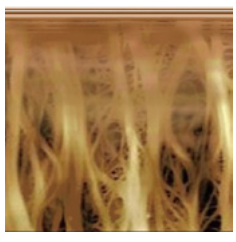
Laser Irradiated **Continuously**



System Without Head-Slide Mechanism
(one example)

Laser Irradiated **Intermittently**





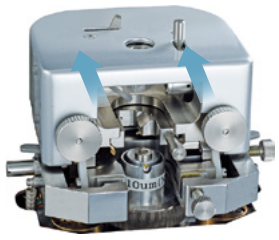
HT

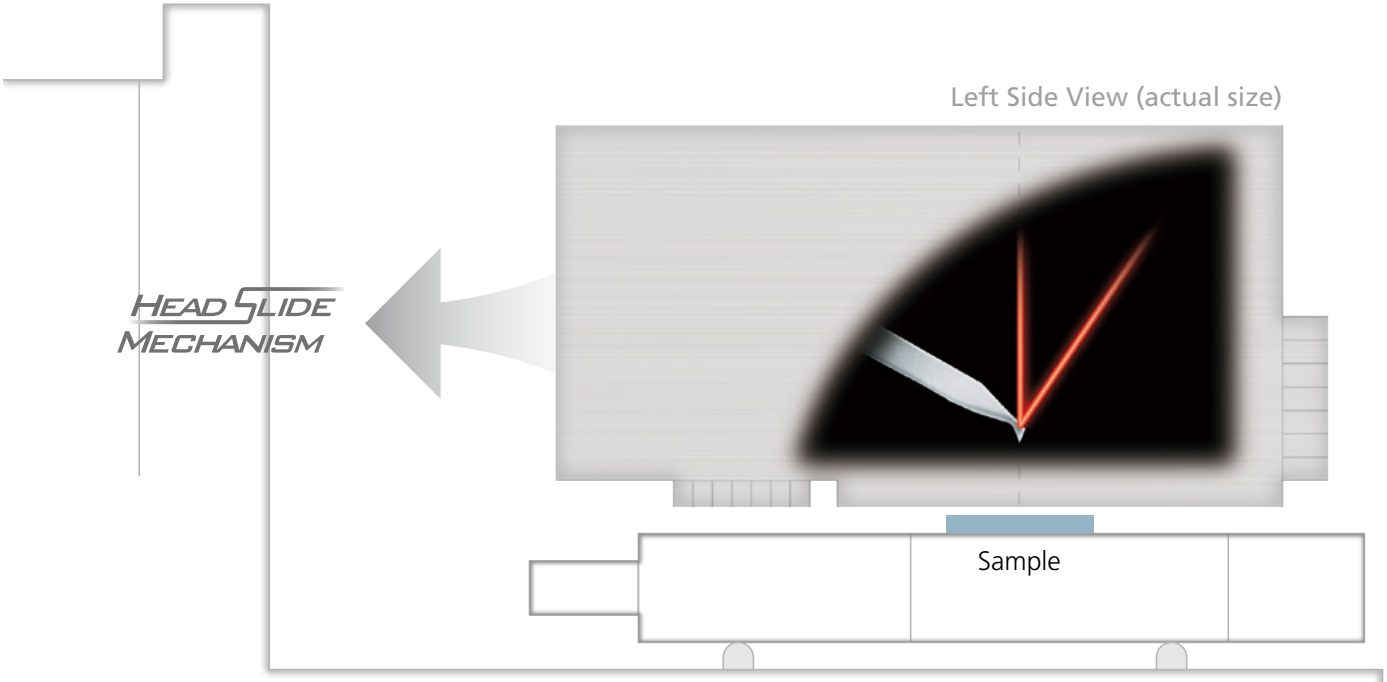
Head-Slide Mechanism — High Throughput

Successfully Opened Up the Area Around the Sample While Maintaining High Rigidity

- Samples can be replaced without removing the cantilever holder.
- Samples can be accessed even during SPM observation.
- Samples are approached automatically, regardless of thesample thickness.

(Japanese Patent No. 2833491)





Secret to the High Throughput of the SPM-9700HT

Remarkable Mechanism Optimized for Ease of Operation
—Comparison of Throughput for Differences in Replacing Samples—

SPM-9700HT

Samples Replaced by **Sliding** the Head

Slide head → Replace sample → Slide head back → Approach → Set parameters → Observe → Save → Switch to next sample

Dramatically Faster

System Without Head-Slide Mechanism
(one example)

Samples Replaced by **Disassembling** the Head

Open enclosure → Remove head screws → Remove head → Remove cantilever holder → Replace sample → Install cantilever holder → Set up optical microscope → Switch light ON → Approach while viewing via microscope → Install head → Fasten head screws

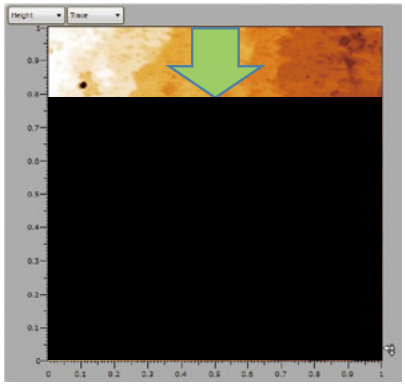
Adjust optical axis → Switch light OFF → Adjust photo-detector → Remove optical microscope → Close enclosure → Wait for stabilization → Approach again → Set parameters → Observe → Save → Switch to next sample

High-Throughput Scanner Shortens Observation Times

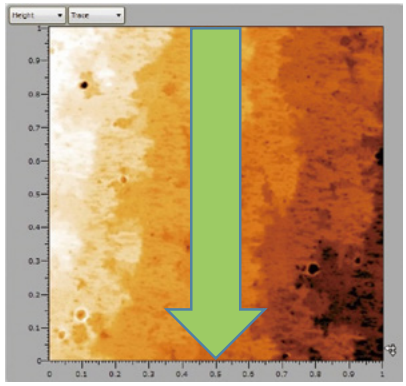
Due to the new deveopled HT scanner that achieves a high-speed response and optimizing softwares and the design of control system, aquisition of the image data is now available at a speed of conventional than 5 times or more (our ratio).

HT scanner

Maximum scanning range (X, Y, Z):
10 µm × 10 µm × 1 µm



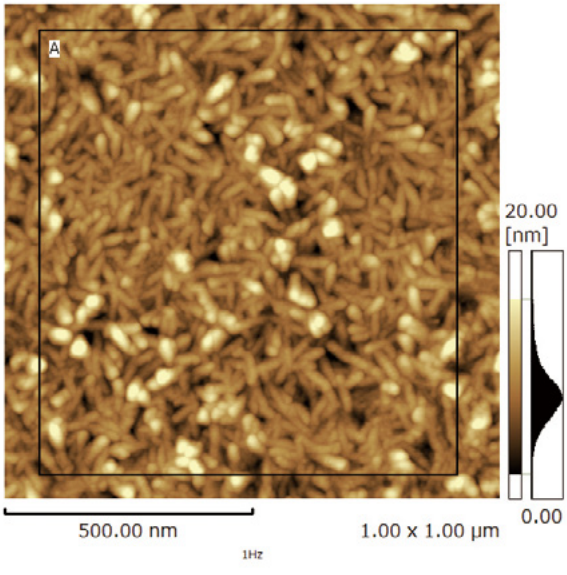
Existing model



SPM-9700HT

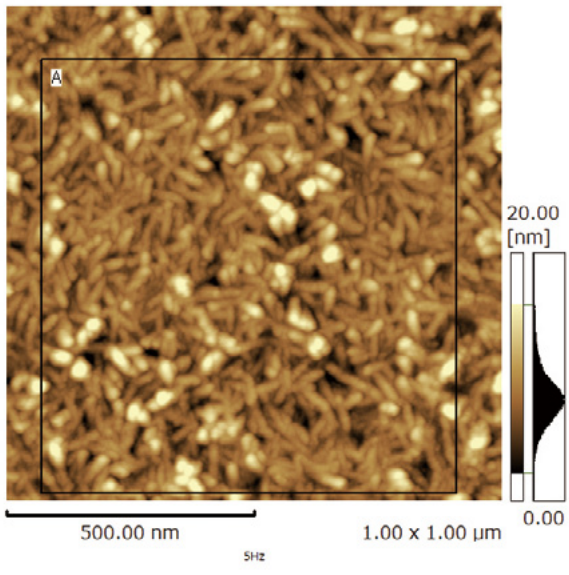
Analysis Example

- Surface Roughness Analysis of a Vapor-Deposited Metal Film
  The surface topology of a vapor-deposited metal film was observed using a scanning rate of 1 Hz and 5 Hz.
  Image quality and surface roughness analysis results are equivalent.



All Area Ra 2.448[nm]
A Ra 2.433[nm]

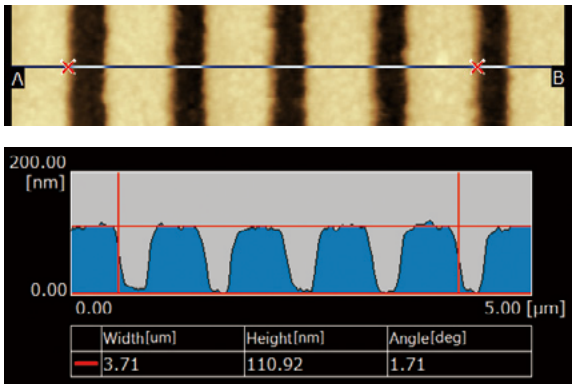
Overall
Scanning rate 1 Hz



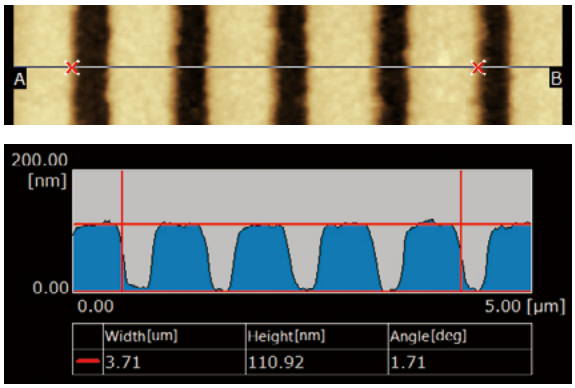
All Area Ra 2.515[nm]
A Ra 2.494[nm]

Overall
Scanning rate 5 Hz

● Grating Surface Topology Measurement
The grating surface topology was observed at a scanning rate of 1 Hz and 5 Hz. The measurement by cross-section profile analysis shows that both give the same results.



Scanning rate 1 Hz



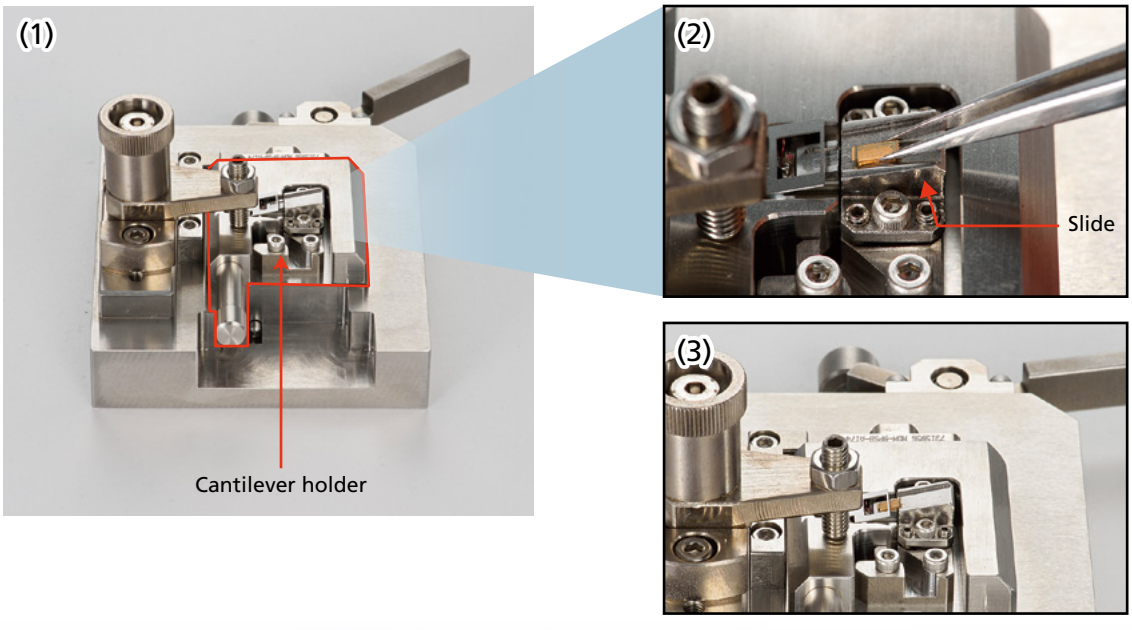
Scanning rate 5 Hz

HT

CantileverMaster Cantilever Mounting Jig (option)

This jig ensures easy and secure mounting of the cantilever.

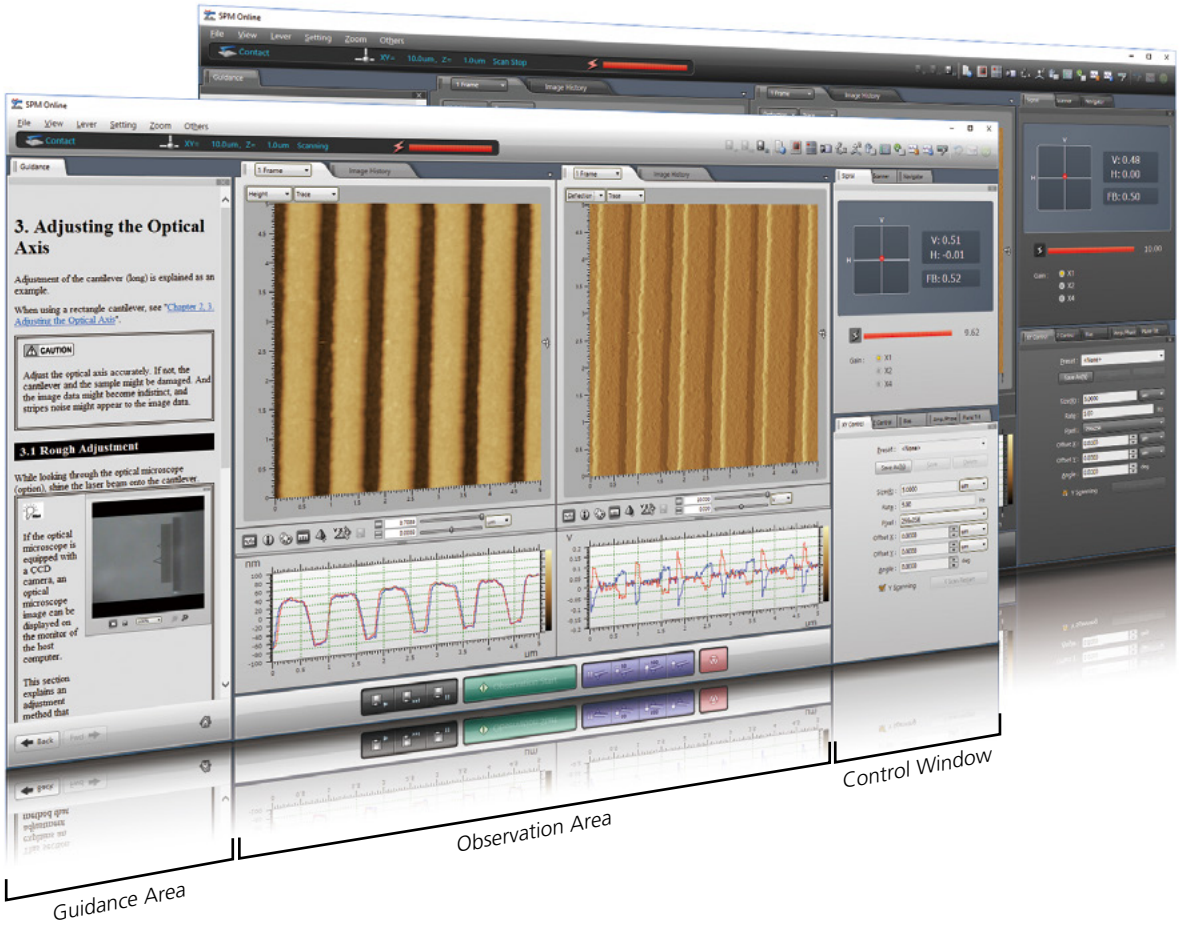
Mounting procedure:
(1) Set the cantilever holder in the cantilever mounting jig.
(2) Place the cantilever on the slide.
(3) Slide the the cantilever onto the cantilever holder, and secure it.



HT

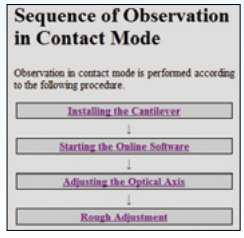
Ease of Operation Minimizes Distraction from Observation to Analysis

A revolutionary layout-free graphical user interface (GUI) provides borderless support for operations ranging from online observation to offline analysis. This means the SPM can be operated from observation to analysis without confusion.



Operate Without Confusion

From startup to observation and analysis, the SPM can be operated using only mouse clicks; no complicated settings are required



1 Startup

Select the observation mode in the manager window.

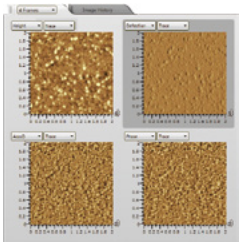
2 Setup

Follow the steps indicated in the guidance window to easily complete setup.

3 Start Observation

Clicking the [Observation Start] button performs all operations automatically, from approach to observation.

Determine the Observation Position Without Confusion



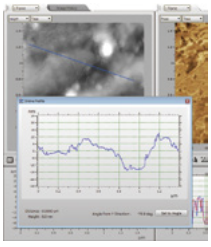
1 Observation Window

Up to 8 images can be displayed simultaneously. This means the surface shape and physical properties can be compared in multiple images, while scanning.

2 Navigator

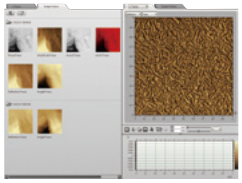
The Navigator allows freely navigating from a broad area to any specific area desired. Saved image data can be displayed as reference as well.

Obtain Observation Results Without Confusion



3 Online Profile

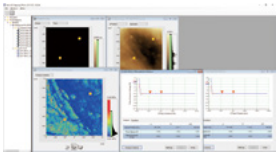
Cross-section profiles can be measured in the online window while observing samples.



4 Image History

Past image data can be displayed next to current observation images for comparison.

Wide Assortment of Scanning Functions



5 Nano 3D Mapping (option)

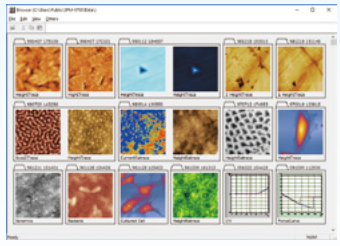
A force curve can be measured for each point in observed image data to acquire a distribution of sample mechanical properties or adhesion force.

6 Vector Scanning (special order)

The scanning direction, force between the probe and sample, or the applied voltage can be programmed to allow scanning according to a program.

4 Display

Image data observed in the past can be viewed without switching offline.



5 Offline Analysis

A wide selection of functions for displaying, processing, and analyzing images are available for expressing observation results more attractively and quantitatively.

Improved Usability!

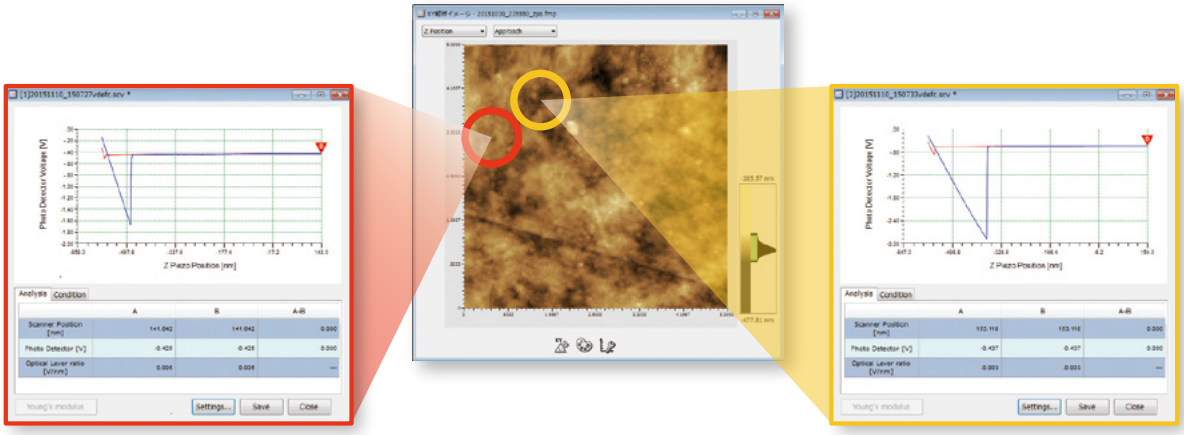
Visualizing the Physical Properties of Nano-Regions on Surface or Interface

The physical properties of external or boundary surfaces can be evaluated by measuring the force acting on a scanning probe microscope cantilever probe as its distance from the sample is varied (force curve measurement).

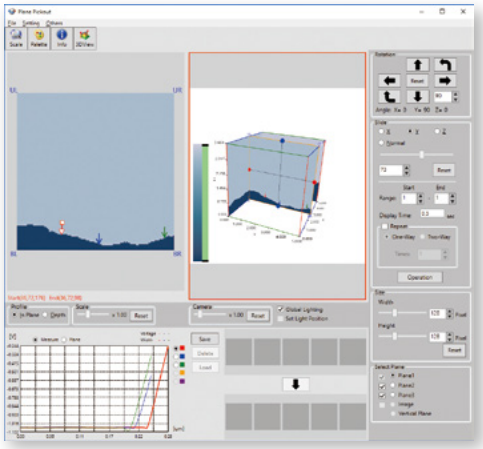
Key Features

1. The adhesive force and Young's modulus can be evaluated at a specific target location by measuring the force curve at that point (point analysis).
2. By acquiring force curves at multiple points, a two-dimension map of the physical properties can be created (mapping analysis).
3. Acquired data can be displayed three-dimensionally, or specific data can be extracted for data analysis (3D analysis).
4. Quantitative Young's modulus values can be calculated from a theoretical model.

Evaluating Physical Properties at Any Point on a Film



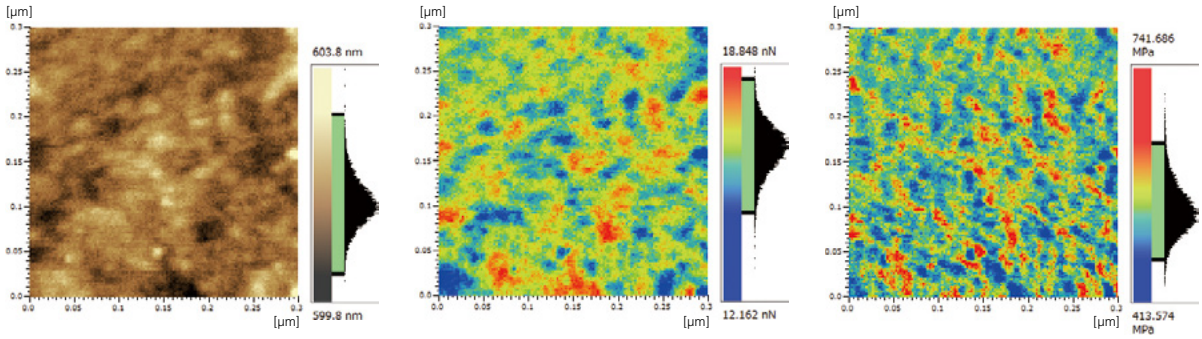
Force curves were measured at arbitrary points on a film surface. The results show that the adhesive force is different at the respective points.
Similarly, physical properties can also be evaluated on small soft samples, such as biopolymers.



- **3D Analysis**

All force curves acquired for mapping are saved. Therefore, the data can be displayed three-dimensionally, or specific cross sections can be extracted for data analysis.

Mapping the Physical Properties of Plastic Films

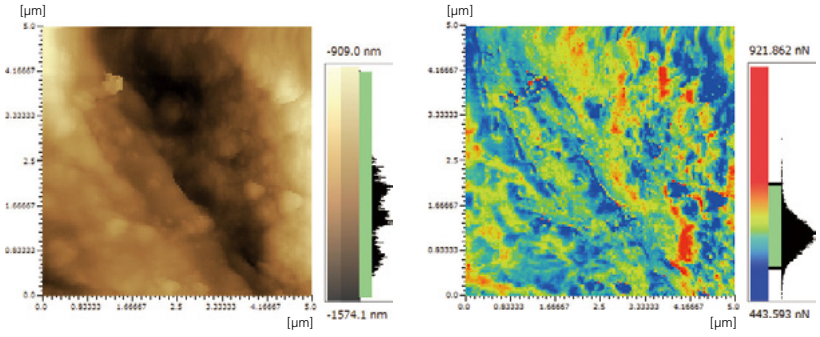


Surface topography | Adhesive force | Young's modulus

Mapping analysis can be used to measure adhesive force and Young's modulus as well as surface topography. The figure shows a quantitative visualization of the Young's modulus within a localized area only 300 nm wide on a plastic film surface. (Sample source: MORESCO)

Application example Evaluating the uniformity of a polymer material surface

Adhesive Part of an Adhesive Tape



Surface topography | Adhesive force

These images are from an evaluation of the adhesive part of an adhesive tape. They show that the adhesive force is distributed non-uniformly. This demonstrates how the system can be used to evaluate adhesive properties, which were difficult to evaluate using conventional methods.

Application example Evaluating the localized adhesive properties of thin films.

Main Specifications

Force Curve

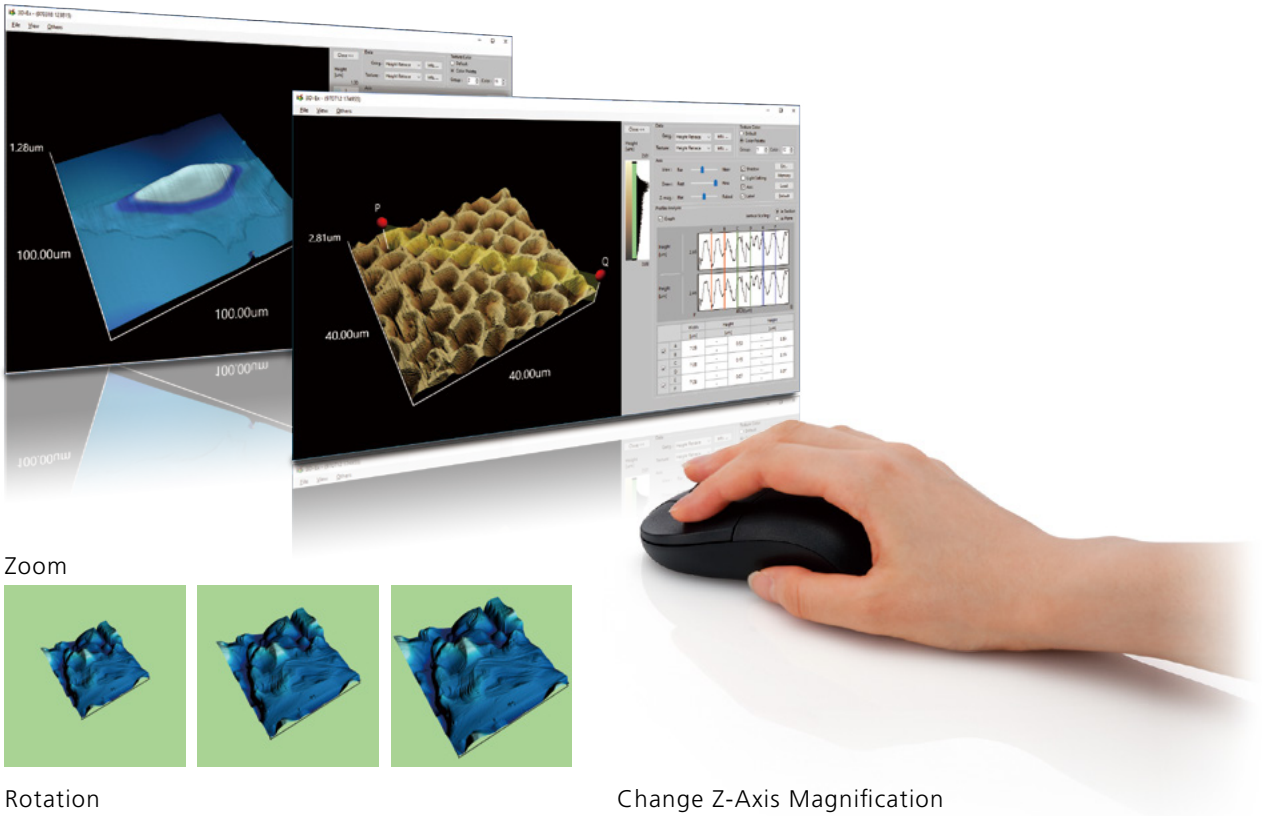
Measurement	Scan (Z) range	Settings method	Specify end point and width, and automatically track end point
		Range	Depends on scanner
	Scanning speed	Frequency setting	0.1 to 100 Hz
		Frequency setting step size	0.1 Hz
	XY movement	Settings method	Numerical entry, or specified with mouse on SPM image
		Range	Depends on scanner
Display	SPM image data, force curve waveform, measurement parameters, and data analysis results		

Mapping

Measurement	Physical quantities measured	Adsorption force, slope of force curve, Z-position, or elastic modulus
	Range	Depends on scanner
	Resolution	512×512, 256×256, 128×128, 64×64, 32×32, 16×16, 8×8, 4×4, 2×2
Display	SPM image data, force curve waveform, and measurement parameters	

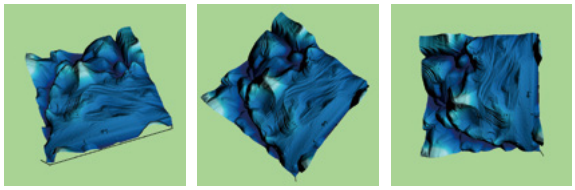
Wide Variety of 3D Rendering Functions Using Mouse Operations

Use the mouse to freely rotate images, zoom, or change the Z-axis magnification.
This enables expressing image data in a variety of ways while confirming the data in real time.

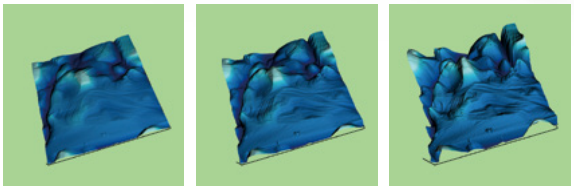


Zoom

Rotation

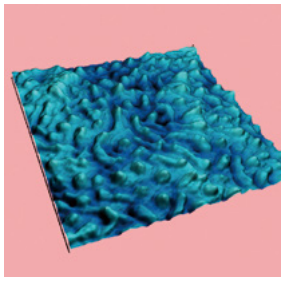


Change Z-Axis Magnification

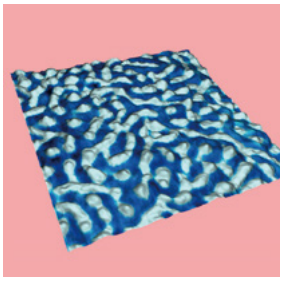


Texture Function

Height information can be displayed overlaid with information about other physical properties. This allows clearly showing the relationship between both parameters.



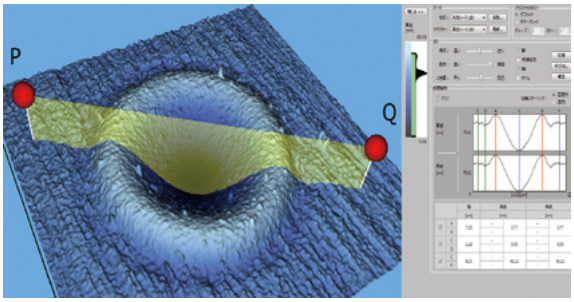
3D Image



Overlay of Topographic Image and Phase Image

3D Cross-Section Profile Analysis

Cross-section profiles can be analyzed in 3D images.
If physical property information is expressed in terms of texture, respective cross-section profiles can be displayed and analyzed in the same location.



Particle Analysis Software (option)

The particle analysis software extracts multiple particles from SPM-9700 image data and calculates feature values for each particle, then analyzes and displays them. This is especially useful for processing data statistically. The following wide selection of feature values and their corresponding statistical quantities can be calculated, tabulated, sorted, or graphed. Numerical data can be exported.

Feature Parameters

1 Center X
2 Center Y
3 Maximum Diameter
4 Pattern Width
5 Horizontal Feret Length
6 Vertical Feret Length
7 Radius as Circle excluding Hole
8 Radius as Circle including Hole
9 Mean Radius
10 Mean Radius Variance
11 Nearest Distance
12 Perimeter
13 C Perimeter
14 Maximum Z
15 Minimum Z
16 Average Z
17 Average Round Z
18 Area excluding Holes
19 Area including Holes
20 Surface Area
21 Volume
22 Pattern Direction
23 2nd Moment Direction
24 Area / Feret Area
25 Particle Area / All Area
26 Distortion
27 Circular Degree
28 Roughness
29 Thin Degree

Statistical Values

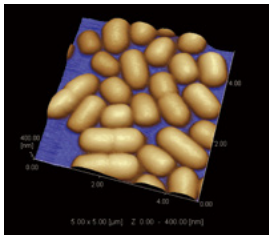
SPM Data Room | Search

01 Living Organisms

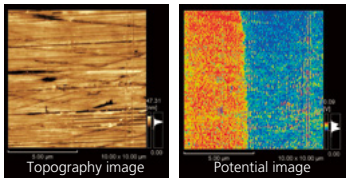
E. coli Bacteria



E. coli bacteria were dried on a substrate and observed in liquid media.
(Data provided by Ms. Ikemoto and Dr. Kogure, Atmosphere and Ocean Research Institute, The University of Tokyo)

02 Metals

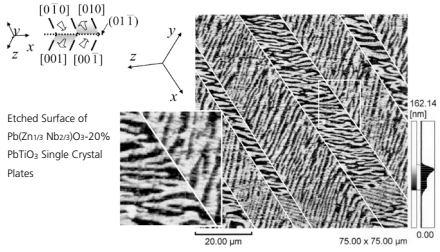
Boundary Surface of Plating Layer



A cross-section of a copper (Cu) plated iron (Fe) sample was prepared, and the electric potential measured along the boundary surface. The topographic image on the left does not show any change in thickness, but the electric potential image on the right shows that the iron portion has a potential that is about 90 mV higher.

03 Non-Metals

Ferroelectric Domains

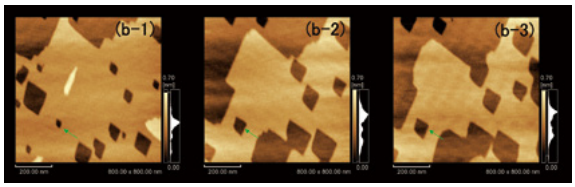


Etched Surface of $Pb(Zn_{1/3}Nb_{2/3})O_3$-20% $PbTiO_3$ Single Crystal Plates

By etching the surface, the domain wall structure of ferroelectric crystal surfaces can be observed.
(Data provided by Dr. Iwata, Faculty of Engineering, Nagoya Institute of Technology)

04 Minerals

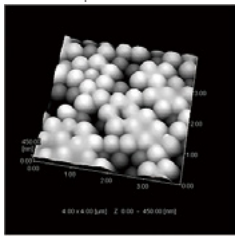
Observation of Calcite in Solution



The crystal dissolution process of calcite in solution was observed. Propagation steps of about 0.3 nm, due to dissolution, were observed. About 10 minutes elapsed between (b-1) and (b-3).
(Data provided by Dr. Kagi, School of Science, The University of Tokyo)

05 Ceramics

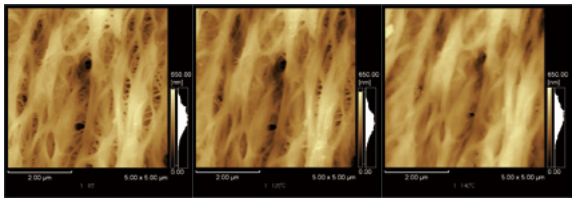
Film Dispersed with Silica



Film material with mono-dispersed spherical silica dispersed in an organic binder. This clearly shows how the binder binds the spherical particles.
(Data provided by Japan Fine Ceramics Center (JFCC))

06 Polymers

Li-Ion Battery Separator

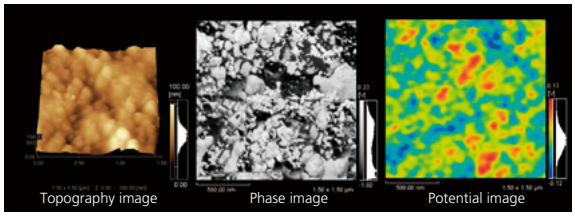


Room Temperature 125 °C 140 °C

The separator surface was observed after removal from the lithium-ion battery. Heated observation shows how the fiber swells at high temperatures and fills the pores.

07 Powders

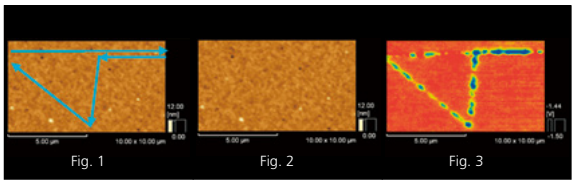
Toner Particle



The top part of one toner particle was observed at high magnification. A topographic image of the surface is shown on the left. Phase and surface potential (KFM) images are shown on the right. The images on the right show how comparing images of different properties in the same field of view allows correlating the distribution of toner material and external additives with the corresponding electric potential distribution.

08 Nanotechnology

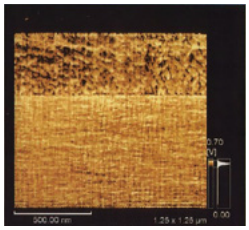
Rendering Images Using Electric Potential



Vector scanning was used on a gold vapor deposition surface on a silicon substrate to render the trace shown in Fig. 1. A conductive cantilever was used to apply a tiny electric potential between the sample and probe. After rendering, simultaneous AFM and KFM measurements showed no change in the shape of the AFM image (Fig. 2), but the potential measured along the trace in the KFM image (Fig. 3) was about 50 mV lower than the surrounding area.

09 Thin Films

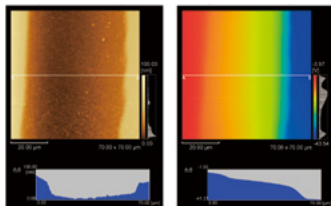
Cross-Section of Thin Film



A cross-section of an organic thin film vapor-deposited on a silicon substrate was observed with the SPM by turning the sample so the cut edge faced upward. The boundary can be clearly observed. This shows that about the top 1/3 is the organic film layer, which is 390 nm thick. This application example is only possible because of the stable probe control provided by the SPM-9700HT.

10 Semiconductors

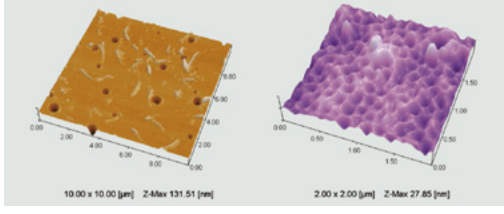
Electric Potential Analysis of Organic Thin Film Transistor (FET)



This is an example of analyzing the shape and electric potential of organic thin film transistors, which have gained attention for their use in flexible displays and other applications. The film material is P3HT (3-hexylthiophene), which provides high electron mobility. To use the SPM for actual measurement, the source electrode was grounded and an electric potential was applied independently to the gate and drain electrodes, then the variation in surface potential on the gate was determined.
(Data provided by Dr. Fukuda, Department of Information and Electronic Engineering, Muroran Institute of Technology)

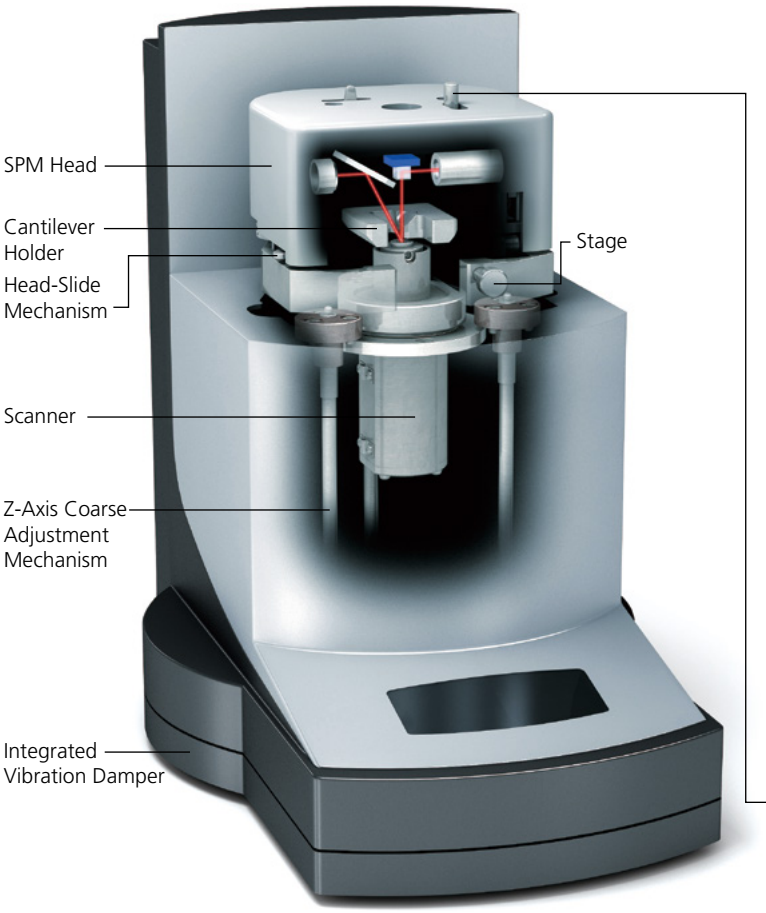
11 Coatings

Baking Finished Surface



The coated surface shows many holes from outgassing. The metallic painted surface (left) shows it contains metal fibers.

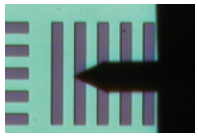
SPM Unit



Example of Optical Microscope Setups

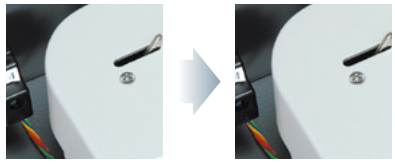
- High Magnification Optical Microscope Unit (with Camera)
  Magnification of Display Monitor:
  48× to 900× zoom (14-inch display mode)
  including coaxial epi-illumination
- Optical Microscope Unit (with Camera)
  Magnification of Display Monitor:
  100× (14-inch display mode)
- Optical Microscope Unit (without Camera)
  Magnification: 40× (20× ocular and 2× objective)

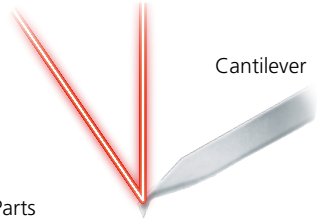
Example of Observing a Sample and Cantilever Using the High Magnification Optical Microscope Unit



The splitter slide mechanism enables obtaining a bright optical microscope image.
Field-of-View:
270 µm × 180 µm
Cantilever: NCH

OFF ON





Specifications for SPM Unit

Resolution	XY: 0.2 nm, Z: 0.01 nm
Max. Scanning Range (X, Y, Z)	HT Scanner Unit X·Y: 10 µm Z: 1 µm (standard) Middle Range Scanner Unit X·Y: 30 µm Z: 5 µm (optional) Wide Range Scanner Unit X·Y: 125 µm Z: 7 µm (optional) Deep-type Scanner Unit X·Y: 55 µm Z: 13 µm (optional) Narrow Range Scanner Unit X·Y: 2.5 µm Z: 0.3 µm (optional)
Stage	Max. sample size: 24 mm dia. × 8 mm (stage for ø35mm or ø50mm are available as a special order item) Sample replacement method: Head-slide mechanism with integrated displacement detection system and cantilever Samples can be replaced without removing cantilever. Sample securing method: Secured with magnets

Consumable Parts

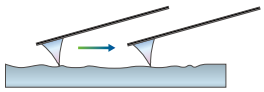
Cantilever for contact mode	Si	Set of 10 chips~
Cantilever for dynamic mode	Si	Set of 10 chips~
Cantilever for magnetic force mode (MFM)	Si	Set of 10 chips~
Cantilever for current mode	Si	Set of 10 chips~
Cantilever for surface potential mode (KFM)	Si	Set of 10 chips~

* Many other types of cantilevers are also available.
Contact your Shimadzu representative for details.

Standard Functions

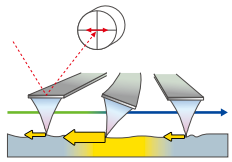
Contact Mode

This mode creates an image of displacement in the sample height direction by scanning the sample surface with the repulsive force acting between the cantilever tip and sample kept constant. Force curves can be measured as well.



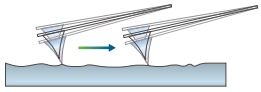
Lateral Force Mode (LFM)

By detecting the amount of twist in the cantilever during contact mode scanning, an image can be created from information corresponding to lateral forces (friction) acting between the sample and cantilever.



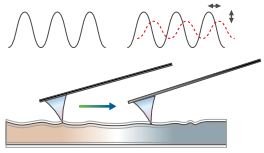
Dynamic Mode

This mode vibrates the cantilever near its resonant frequency. Since the amplitude changes as the cantilever approaches the sample, a sample height displacement image can be created by moving the probe to keep the amplitude constant.
Force curves can be measured as well.



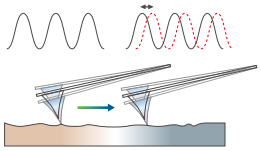
Force Modulation Mode

This mode vibrates the sample at constant amplitude and frequency during contact mode scanning. The cantilever response is detected by separating it into its amplitude and phase components. This allows creating an image of differences in sample surface properties.



Phase Mode

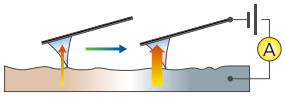
This mode detects the phase shift delay in the cantilever vibration during dynamic mode scanning. This allows creating an image of differences in sample surface properties.



Optional Functions

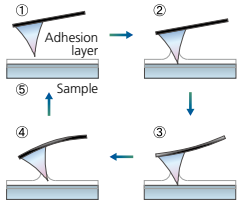
Current Mode

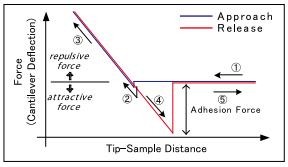
This mode applies a voltage between a conductive cantilever and sample during contact mode scanning and creates an image from the distribution of current flows.
I/V measurement is also possible.



Nano 3D Mapping

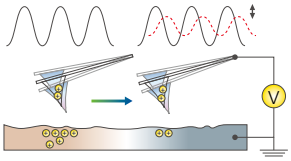
A force curve can be measured for each point in observed image data to observe a distribution of sample mechanical properties or adhesive strength.





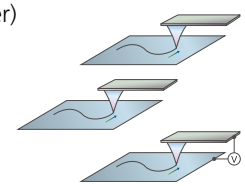
Surface Potential Mode (KFM)

An image can be created from the electric potential of the sample surface by applying an alternating current electrical signal to a conductive cantilever and detecting the static electric force acting between the sample surface and cantilever.



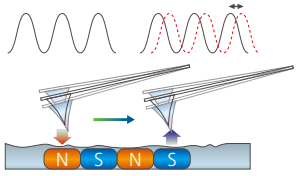
Vector Scanning (special order)

The scanning direction, force between the probe and sample, or the applied voltage can be programmed to allow scanning according to a program.



Magnetic Force Mode (MFM)

This mode scans the sample with a magnetic tipped cantilever kept at a constant distance from the sample. An image can be created from magnetic information of the sample surface obtained by detecting the magnetic force from the magnetic leakage field.



Sample Heating Unit

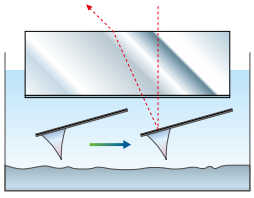
The sample can be loaded into the unit and heated.

Light Irradiation Unit

This unit enables the use of a fiber optic light to irradiate sample surfaces. It does not include the light source or the optical fiber.

Petri Dish Type Solution Cell (special order)

The sample is attached to the bottom of a small petri dish, which is then filled with solution. By scanning with the cantilever immersed in solution, AFM observations can be performed in solutions.



Electrochemical Solution Cell

This cell is used for AFM observations of sample surface changes while an electrochemical reaction occurs in an electrolytic solution. The cell includes three standard electrodes (working, counter, and reference) and includes a petri dish type solution cell.
(Does not include the separately-ordered electrochemical controller (potentiostat).)

Specifications

1. SPM Unit

Observation Modes	Standard	Contact Dynamic Phase Lateral Force (LFM) Force Modulation
Resolution	Optional	Magnetic Force (MFM) Current Surface Potential (KFM)
SPM Head	X, Y	0.2 nm
	Z	0.01 nm
	Displacement detection system	Light source/Optical lever/Detector
	Light source	Laser diode (ON/OFF) Irradiates cantilever continuously, even while replacing samples.
Scanner	Detector	Photodetector
	Drive element	Tube piezoelectric element
	Max. scanning size (X, Y, Z)	10 µm × 10 µm × 1 µm (standard) 30 µm × 30 µm × 5 µm (optional) 125 µm × 125 µm × 7 µm (optional) 55 µm × 55 µm × 13 µm (optional) 2.5 µm × 2.5 µm × 0.3 µm (optional)
Stage	Max. sample size	24 mm dia. × 8 mm
	Sample replacement method	Head-slide mechanism with integrated displacement detection system and cantilever Samples can be replaced without removing cantilever.
	Sample securing method	Magnet
Z-Axis Coarse Adjustment Mechanism	Method	Automatic, using stepping motor Fully automatic, regardless of sample thickness
	Max. stroke	10 mm
Signal Display Panel	Displayed quantity	Total incident light to detector (digital display)
Vibration Isolation System	Vibration Damper	Built into SPM unit
Optical Microscope Observation	Method	Beam-splitter slide mechanism
Specialized enclosure	Method	Not necessary.

2. Control Unit

Scan Controller	X/Y-axis control	±211 V, full time 16-bit accuracy
	Z-axis control	±211 V, max. 26-bit accuracy
Feedback Controller	Control system	Digital control by DSP
Data Acquisition Controller	Input signal	5 channels (standard) 7 channels (optional)
Communications Interface	Protocol	TCP/IP

3. Data Processing Unit

Host Computer	Operating system	Windows® 10 Pro (64 bit), English version
	Strorage	HDD 160 GB min. CD-RW drive
Monitor	Panel	Flat panel display Display resolution: 1920 × 1080 pixels
Communications Interface	Protocol	TCP/IP

4. Software

Online	Input Signal	Select from up to 6 signals.
	Image data display	Maximum 8 images can be displayed simultaneously.
	Scanning direction	Trace/retrace (simultaneous observation possible) Angle setting can be changed.
	Scanning size	0.1 nm to max. scanning size (depending on scanner type) Offset setting can be changed.
	Number of pixels	2048 × 2048, 1024 × 1024, 512 × 512, 256 × 256, 128 × 128, 64 × 64, 32 × 32
	Data size	Approx. 16 MB to 64 kB/data
	Observation window	Multiple frames display: 1 frame, frames, 2 frame, frames (Vertical or Horizontal), or 4 frame, frames Z-axis display range settings (display range, offset) Color palette settings (400 types) Tilt correction setting Image history display modes (list, single screen)
	Profile display	Display cross-section profile during scanning, and save (both directions). Display cross-section profile at scanning position, analyze profile between any two points.
	Status display	Display the operating status of the main unit.
	Preset	Register and retrieve parameter settings.
	Calibration	Independent calibration of each axis (X, Y, and Z)
	Scanning	Switch XY-scanning ON/OFF Switch Y-scanning ON/OFF Y-scanning can be restarted. Y-scanning start position can be changed (top, center, or bottom).
	Signal display	Display detector vertical/horizontal variation signal. Display feedback signal. Display laser intensity.
	Navigator	Display scanning size, move positions, change scanning size, change angle. Load and display image data.
	Image history	Display list of saved images or display saved images. Display cross-section profile or analyze profile between any two points. Display operating procedures.
Offline	Guidance	List in thumbnail mode
	Browser	Delete, copy, move, or search data. Change group names or data names. Create/delete folders.
	Image data display	Variable shade image (top view) display (length measurement possible) Pseudo-3D display, 3D display Zoom in/out or rotate 3D display (mouse operation possible) Analyze cross-section profile of 3D display. Set light source, view angle, and gloss settings for 3D-image display. Display contour lines. Create, edit, and select color palettes. Change Z-axis range setting, set Z-axis units. Reduce/enlarge image, create as icon. Display image data information (parameters, image processing history, comments). Enter and display comments.
	Line data display	Overlay, tile, overwrite. Line colors can be changed. Reduce/enlarge image, create as icon.
	Image data processing	Flatten, erase noisy lines. Local filter, spectrum filter Zoom, invert, and rotate image. Resample, extract lines, use macro functions.
	Image data analysis	Profile analysis, line roughness analysis. Surface roughness analysis, topography analysis, step measurement. Power spectrum analysis, autocorrelation analysis Fractal analysis, line length analysys, line roughness analysis
	File output	DIB formant (bitmap) TIFF format, ASCII format

Installation Specifications

- **Installation Environment**

  The following conditions are appropriate for theroom where the SPM is installed.
  Temperature : 23 °C ± 5 °C
  Relative Humidity : 60 % max.

- **Power Supply**

  The following power supply is required to operate the SPM-9700HT.
  Single-phase 100 – 120 V / 200 – 240 V, 50/60 Hz, 15 A - 2 circuits
  Grounding Resistance: 100 Ω max.
  * The power supply indicated above is for a basic configuration of the SPM-9700HT and can vary depending on the options included. Please see specifications for details.

- **Size and Weight of Units**

SPM Unit	W180 × D255 × H260 mm	5.5 kg
Controller	W250 × D420 × H454 mm	18.5 kg

Installation Example

* Figure shows example of one possible configuration.
